

Gnome Street Gnome Raspberry Pi

Headless

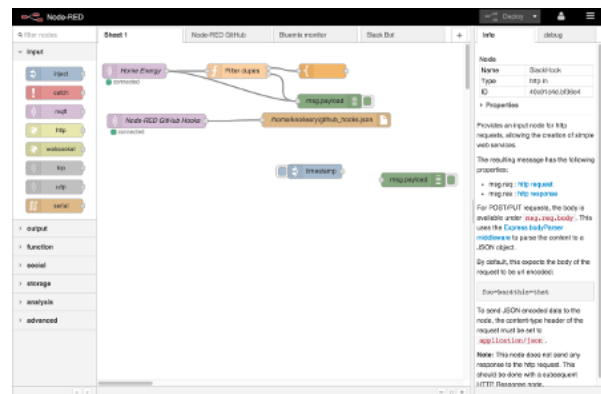

We are running our Pi without a screen and keyboard. To do this requires the device to be already setup to access the Wifi.

Bonjour

This software is installed on our Windows machines so that we can access the Pi by it's name e.g. "RaspberryPi.Local" rather than needing to know it's number. Note that if you've installed Itunes you will already have this installed.

Node-Red

This software allows us to wire together inputs and outputs in flows. We can access this via a web browser on the laptop.
